

ABSTRACT OF THE DISCLOSURE

The display device comprises: a substrate 50 having a plurality of light emitting elements on one surface thereof, and a substrate 10 having a circuit for controlling the plurality of the light emitting elements, bonded to said one surface of the substrate 50, and sealing a space where the plurality of the light emitting elements are formed. This makes it possible to form the light emitting elements on a flat surface, and the degradation of the emission characteristics of the light emitting elements can be prevented. The aperture ratio and the luminance of the display device can be also increased.
